phenylalanine ammonia-lyase (EC 4.3.1.5) - s
C; Species: Ipomoea batatas (sweet potato)
C; Date: 25-Feb-1994 #sequence_revision 10-Nc
C; Accession: $29029
R; Tanaka, Y.; Matsuoka, M.; Yamanoto, N.; OP
Plant Physiol. 90, 1403-1407, 1989
A; Title: Structure and characterization of a
A; Reference number: $29029
A; Reference number: $29029
A; Molecule type: mRNA
A; Residues: 1-707 <TAN>
C; Superfamily: histidine ammonia-lyase
C; Superfamily: histidine ammonia-lyase
C; Keywords: ammonia-lyase; carbon-nitrogen 1
F; 192-194/Cross-link: 5-imidazolinone (Ala-G F; 193/Modified site: dehydroalanine (Ser) #s

```
The present sequence is human glycosyl sulfotransferase-4alpha (GST-4 alpha). GST-4 gene is found on chromosome 16q23.1.

GST is a type 2 membrane protein useful for inhibiting a binding event selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, which comprises contacting the agent that inhibits the sulphation activity of GST as as and molecular agent that inhibits the sulphation activity of GST is useful in gene therapy to treat disorders such as acute or chronic inflammation, systemic lupus erythematosus (SLE), rheumatoid arthritis, polyarteritis nodosa, polymyositis, dermatomyositis, systemic sclerosis, diabetes, glomerulonephritis, myasthenia gravis, Sjogren's syndrome, Hashimoto's disease, Grave's disease, adrenalitis, hypoparathyroidism, pernicious anaemia, demyelinating diseases, cirrhosis, ulcerative colitis, canaemia, amyocarditis, regional enteritis, adult respiratory distress syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis, bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection of where mhe ancest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 y distress

× derived from open reading, proliferative disorders, sardiovascular disease , proliferative cardiovascular d cancers, and peptides and nucleic acids and pept for treating e.g. car legenerative disorders neurodegenerative Novel nsetı

English. 5507pp; 2599-2600; Page 11;

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipparkinsonian; nootropic; neuroprotective; costeopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatclogical; immunosuppressive; antidiabetic; hypotensive; dermatclogical; immunosuppressive; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating the presence of or predisposition to, or preventing or treating the presence of or predisposition to, or preventing or treating the precipitative disorders, neurodegenerative disorders, neurodegenerative disorders, osteoarthritis, proliferative disorders, neurodegenerative disorders, osteoarthritis, cardinates and nucleic acids may be used to treat cancers, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, coamulation; to inhibit thrombosis; and se a contranentive. $_{

The present sequence is human glycosyl sulfotransferase-4beta (GST-4 beta). GST-4 gene is found on chromosome 16q23.1.

GST is a type 2 membrane protein useful for inhibiting a binding event between a selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphation activity of GST and a small molecular agent that inhibits the sulphation activity of GST. GST is also useful in inhibiting a selectin mediated binding event. GST is useful in gene therapy to treat disorders such as acute or chronic inflammation, condosa, polymyositis, dermatomyositis, rheumatoid arthritis, polyarteritis glomerulonephritis, myasthenia gravis, Sjogren's syndrome, Hashimoto's anaemia, demyelinating disease, cirrhosis, ulcerative colitis, dermatitis, myocarditis, regional enteritis, adult respiratory distress bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection
                                                                                                                                                                                                                                                                                                                            .,

```
The present sequence is mouse glycosyl sulfotransferase-4 (GST-4). GST-4

gene is found on chromosome BEI.

GST is a type 2 membrane protein useful for inhibiting a binding event

between a selectin and a selectin ligand, which comprises contacting the

selectin with a non-sulphated selectin ligand, GST and a small molecular

agent that inhibiting a selectin mediated binding event. GST is useful

in inhibiting a selectin mediated binding event. GST is useful

therapy to treat disorders such as acute or chronic inflammation,

therapy to treat disorders such as acute or chronic inflammation,

systemic lupus erythematosus (SLE), rheumatoid arthritis, polyarteritis

nodosa, polymyositis, dermatomyositis, systemic sclerosis, diabetes,

glomerulonephritis, myasthenia gravis, Sjogren's syndrome, Hashimoto's

disease, Grave's disease, adrenalitis, hypoparathyroidism, pernicious

anaemia, demyelinating diseases, cirrhosis, ulcerative colitis,

dermatitis, myocarditis, regional enteritis, adult respiratory distress

syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis,

bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection

conting transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                           The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length clones were obtained by construction of full length clones were obtained by construction of flength enriched cDNA libraries that were synthesised by the oligo-c method. The primers enable the production of the full length cDNA encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the precification, but was obtained in CD-ROM format directly from EPO.

The nucleic acid sequences, probes and primers derived from these, proteins and antibodies are useful in detecting homologues. The sequences, antibodies are useful in the diagnosis and treatment of diseases associated with selectin binding interactions, including conditions associated with or resulting from the homing of leukocytes to sites of inflammation and the normal homing of lymphocytes to secondary lymph organs.

                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of human transferase TRNSFS-11, 1 of 15 claimed novel human transferase proteins of the invention (see AAY79209-23). The sequence was deduced from a cDNA clone (see AAZ94211) isolated from a gallbladder library. It shows homology to mouse N-acetylglucosamine 6-0-sulfotransferase. TRNSFS-11 is expressed in dermatologic and gastrointestinal tissues, especially those associated with inflammation and cell proliferation. The new human transferases and polynucleotides can be used in the diagnosis, prevention and treatment of cancer, developmental disorders, gastrointestinal disorders, genetic disorders, immunological disorders, neurological disorders, reproductive disorders, and smooth muscle disorders. The polypeptides can also be used to raise antibodies, and to screen of transferase activity.

                                                                                                                                                                                                                                                                                                                                                                                     the invention. The nucleic acid sequences, probes and primers derived from these, proteins and antibodies are useful in detecting homologues. The sequences, antibodies and methods are useful in the diagnosis and treatment of diseases associated with selectin binding interactions, including conditions associated with or resulting from the homing of leukocytes to sites of inflammation and the normal homing of lymphorward to secondary lymph organs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            160
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            161

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents mouse N-acetylglucosamine-6-0-sulfotransferase, an enzyme capable of transferring a sulfate group from a sulfate group donor to a hydroxyl group at the 6 position of an N-acetylglucosamine residue located at the non-reducing end of an oligosaccharide of formula GlcNAcbetal-3Galbetal-4GlcNAc, where GlcNAc = N-acetylglucosamine residue, Gal = galactose residue, beta 1-3 = beta 1-3 glycosidic linkage, and beta 1-4 = beta 1-4 slycosidic linkage. The enzyme is useful for the synthesis of sugar chains such as GlyCAM-1, a ligand of L-selectin that is involved in homing of lymphocytes and rolling of leukocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       harbour

                                                                                                                                                                                                                                                                                                                                                                                 encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cation
to the complementary strand of a polynucleotide which comprises one of
the 5602 nucleotide sequences defined in the specification, where the
oligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
                                                                                                                                                                                                                                                                      the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAH13632 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                     Y to
                                                                                                                                                                                                                                                                in

The present sequence represents human N-acetylglucosamine-6-0-sulfotransferase, an enzyme capable of transferring a sulfate group from a sulfate group donor to a hydroxyl group at the 6 position of an N-acetylglucosamine residue located at the non-reducing end of an oligosaccharide of formula GlcNAcbetal-3Galbetal-4GlcNAc, where GlcNAc = N-acetylglucosamine residue, Gal = galactose residue, beta 1-3 = beta 1-3 glycosidic linkage, and beta 1-4 = beta 1-4 glycosidic linkage. The enzyme is useful for the synthesis of sugar chains such as GlyCAM-1, a ligand of L-selectin that is involved in homing of lymphocytes and rolling of leukocytes occurring at the early stage of inflammation. DNA encoding the enzyme (see AAX87821) is expected to be used for the large-scale production of N-acetylglucosamine-6-0-sulfotransferase, or artificial synthesis of GlyCAM-1 using transformants which harbour
                                                                                                                                                                                                                                              useful
                                                                                                                                                                                                                                                                                                                        represents human N-acetylglucosamine-6-0-enzyme capable of transferring a sulfate group donor to a hydroxyl group at the 6 position of ne residue located at the non-reducing end of formula GlcNAcbetal-3Galbetal-4GlcNAc, where cosamine residue, Gal = galactose residue,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The human glycosaminoglycan sulphotransferase (C6ST) is a type II membrane protein derived from foetal brain tissue with a molecular weight of 50-55 kD. The protein transfers sulphate groups from a donor to the N-acetylgalactosamine residue or galactose residue of glycosaminoglycan. C6ST displays substrate specificity transferring the sulphate group to the hydroxyl group position at C-6 of the N-acetylgalactosamine residue of chondroitin and the hydroxyl group position at C-6 of the galactose residue of keratan sulphate. The protein is useful for studying the function of chondroitin sulphate and can provide chondroitin sulphate that may be useful in pharmaceuticals. Both the protein and DNA might be useful for treating or diagnosing diseases attributable to low C-6 sulphation of chondroitin N-acetylgalactosamine residues.

This sequence produces the protein KSGal6ST (Keratan sulphate
6-sulphotransferase), which has a molecular weight of about 46700. The
6-sulphotransferase (cost) and using the cDNA of
cDNA sequence of this protein was obtained by radiolabelling the cDNA of
c chick chondroitin 6-sulphotransferase (cost) and using this as a probe in
a random oligonucleotide-primed labelling method. Human foetal brain
c clones containing the KSGal6ST were obtained by hybridization using the
c prepared probe. The positive clones were subcloned into a recombinant
c expression vector and used to transform cos-7 cells, from which cells
expressing KSGal6ST can be selected. The phage cDNA inserts were
c isolated and subcloned into a Bluescript plasmid. Deletion clones were
then prepared from which both strands were sequenced by the Sanger
method. The KSGal6ST of the invention transfers the sulphate from a
sulphate donor to galactose 6-OH groups in keratan sulphate from a
transfer sulphate to chondroitin, chondroitin sulphate A or C, dermatan

                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIP at ftp.wipo.int/pub/published_pct_sequences.
